- HashTable/Map/Set
- Tree
- Stack/Queue
- Heap

BITTIGER

# What's Linkedlist?

- A list of Node
- node = value + pointer to next node
- The last node will point to null

# LinkedList in Java

Doubly linked list

source code -

<http://developer.classpath.org/doc/java/util/LinkedList-source.html>

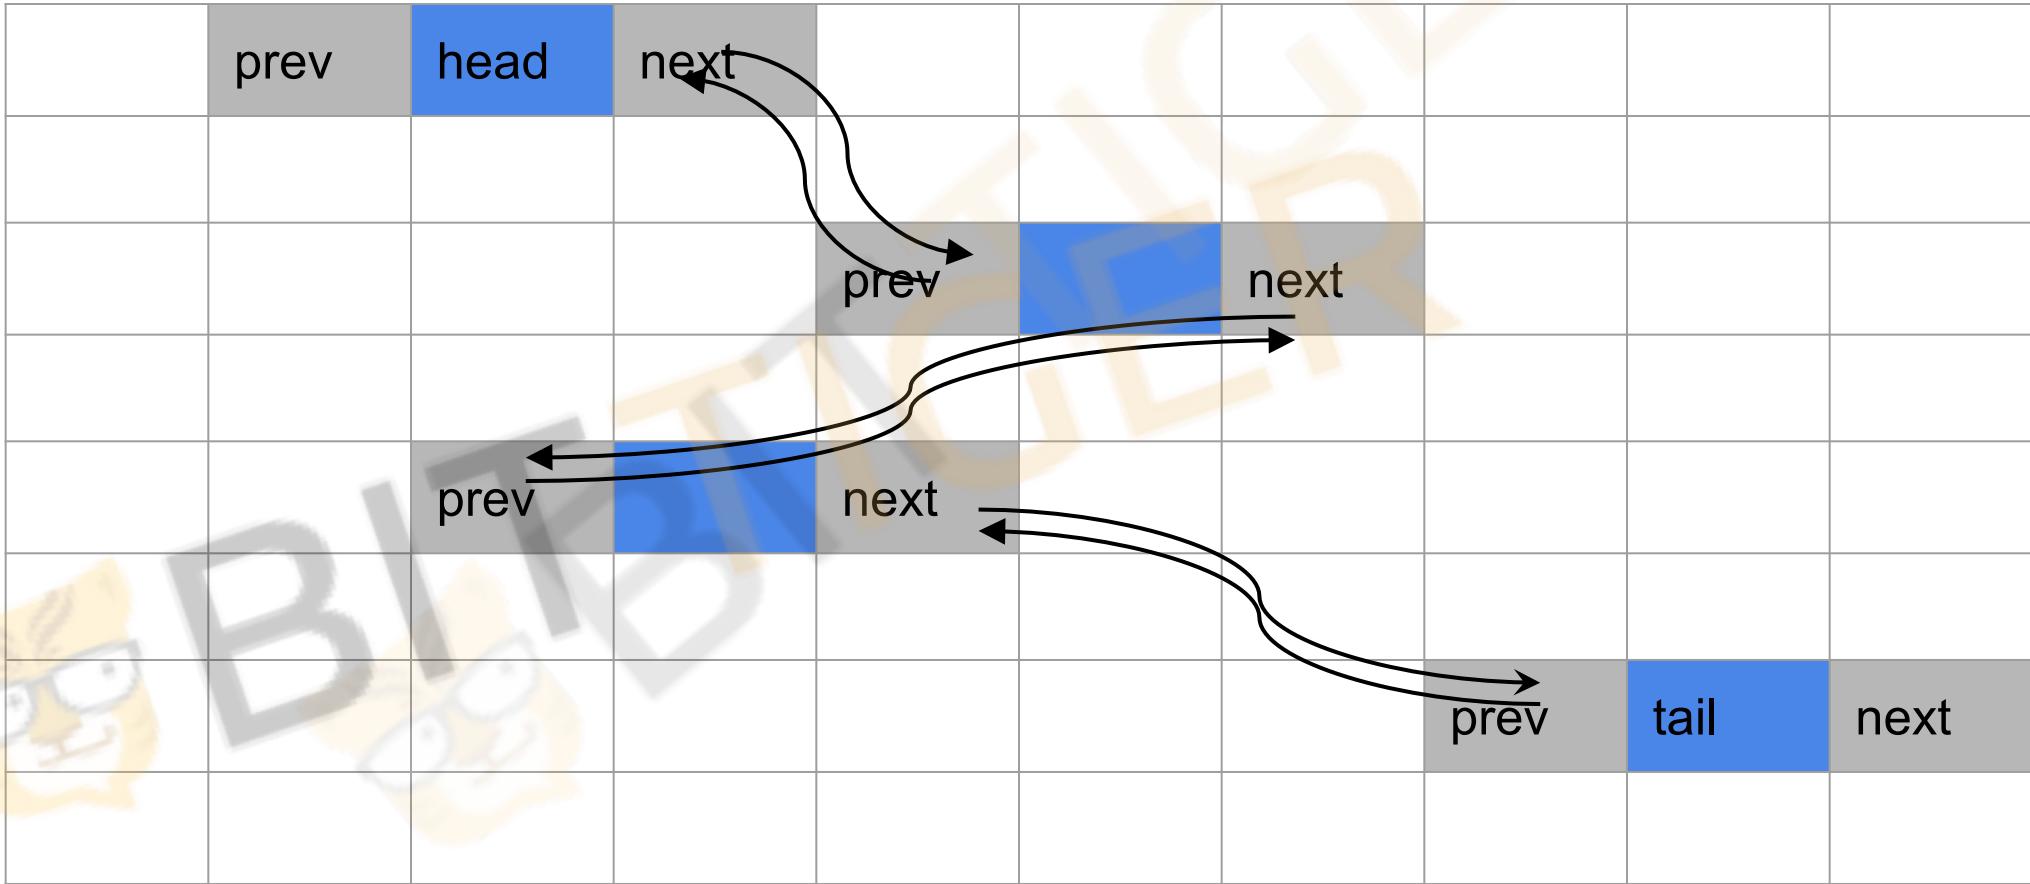

```
public class LinkedList<E> extends ... {  
    Node<E> first;  
    Node<E> last;  
}
```

```
private static class Node<E> {  
    E item;  
    Node<E> next;  
    Node<E> prev;  
  
    Node(Node<E> prev, E element, Node<E> next) {  
        this.item = element;  
        this.next = next;  
        this.prev = prev;  
    }  
}
```

# Doubly LinkedList

# Doubly LinkedList

# LinkedList in Java

- Access:  $O(n)$
- AddFirst:  $O(1)$
- AddLast:  $O(1)$
- RemoveFirst:  $O(1)$
- RemoveLast:  $O(1)$
- Set:  $O(n)$

```
public class LinkedList<E> extends ... {  
    Node<E> first;  
    Node<E> last;  
}
```

```
private static class Node<E> {  
    E item;  
    Node<E> next;  
    Node<E> prev;  
  
    Node(Node<E> prev, E element, Node<E> next) {  
        this.item = element;  
        this.next = next;  
        this.prev = prev;  
    }  
}
```

# Comparison

	<b>ArrayList</b>	<b>LinkedList</b>
<b>Random Access</b>	O(1)	O(n)
<b>Add</b>	O(1) Amortized	O(1)
<b>Remove</b>	O(n)	O(1)
<b>Set</b>	O(1)	O(n)

# Learning by Doing

Cracking the coding interview - Plus one linked list

BITTIGER

# Take-away

- use dummy node to simplify corner cases
- oneway, use two pointers

BITTIGER

# Chapter 3 - Data Structures

- ArrayList
- LinkedList
- HashTable/Map/Set
- Tree
- Stack/Queue
- Heap

BITTIGER

# Object - hashCode()

```
/* Class Object is the root of the class hierarchy. Every class has
Object as a superclass. All objects, including arrays, implement the
methods of this class.*/

public class Object {

    public native int hashCode();

    public String toString() {
        return getClass().getName() + "@" + Integer.toHexString(hashCode());
    }
}
```

# Object - hashCode()

```
int[] a = {1, 2, 3};  
  
System.out.println(a);
```

```
>> [I@61bbe9ba
```

[I	int[]
@	
61bbe9ba	Address

```
public String toString() {  
    return getClass().getName() + "@" +  
    Integer.toHexString(hashCode());  
}
```

# HashCode

Default: memory address

**Object to hashCode:**

(1) One to one

(2) One to many

(3) Many to one

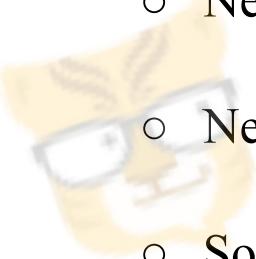

(4) Many to many

**HashCode design 3 principles:**

1. Same code for repeated calling in same application
2. Equal  $\Rightarrow$  Same hash code
3. Same hash code  $\Rightarrow$  Equals, but good to have

# Hash Table

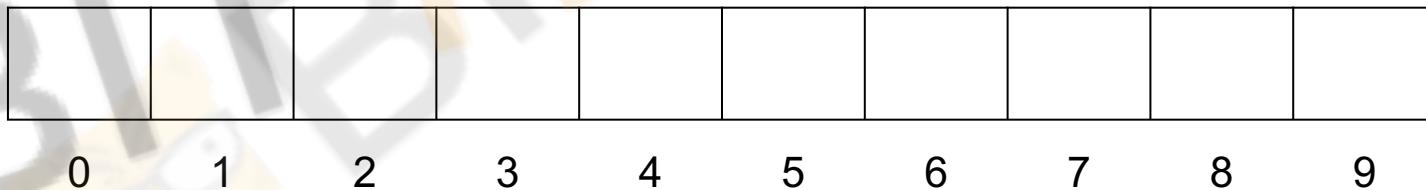

- Searching an element in an array needs \_\_\_\_\_ time complexity.
- Unsorted array:  $O(n)$
- Sorted array:  $O(\log n)$  -- Why?
- What if we want to build an array-based data structure with
  - Near  $O(1)$  search time complexity
  - Near  $O(1)$  to add a new element
  - So we use hashCode to build index!

# Hash Table

Mapping: hashCode  $\Rightarrow$  arrayIndex

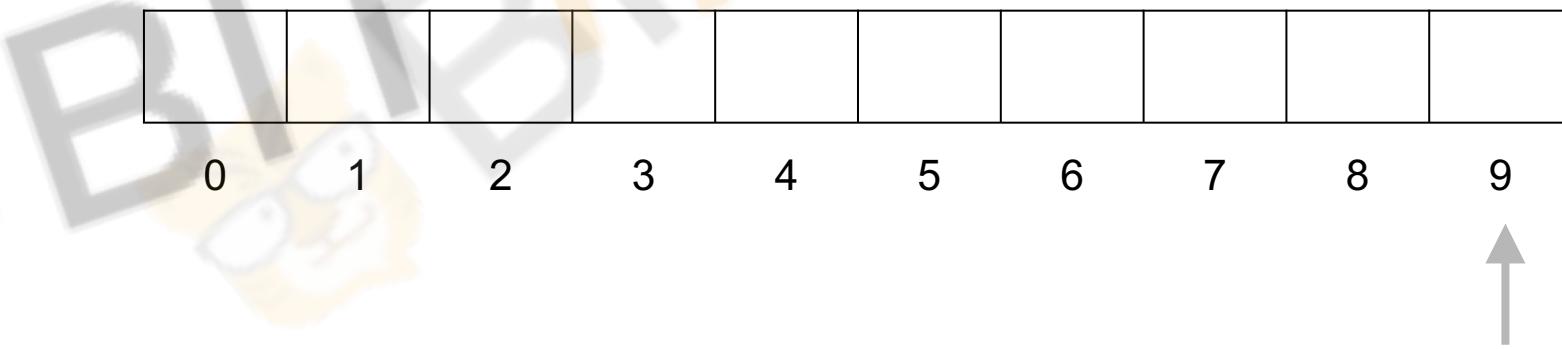

arrayIndex = hashCode % length

# Hash Table

add(119)

$$119 \% 10 = 9$$

# Hash Table

add(119)

$$119 \% 10 = 9$$

add(321)

$$321 \% 10 = 1$$

									119
0	1	2	3	4	5	6	7	8	9

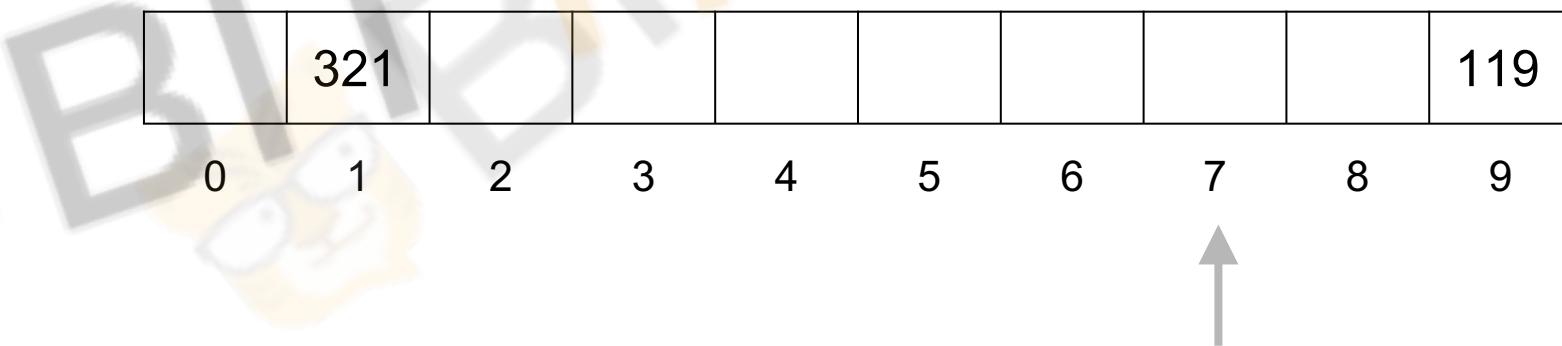

# Hash Table

add(119)                   $119 \% 10 = 9$

add(321)                   $321 \% 10 = 1$

add(157)                   $157 \% 10 = 7$

# Hash Table

add(119)                   $119 \% 10 = 9$

add(321)                   $321 \% 10 = 1$

add(157)                   $157 \% 10 = 7$

	321						157		119
0	1	2	3	4	5	6	7	8	9

# Hash Table

add(119)	$119 \% 10 = 9$
add(321)	$321 \% 10 = 1$
add(157)	$157 \% 10 = 7$
search(119)	$119 \% 10 = 9$

So far:  
add() -- O(1)  
search() -- O(1)

# Hash Table: Linear Probing

add(217)

$$217 \% 10 = 7$$

	321						157		119
0	1	2	3	4	5	6	7	8	9

Collision

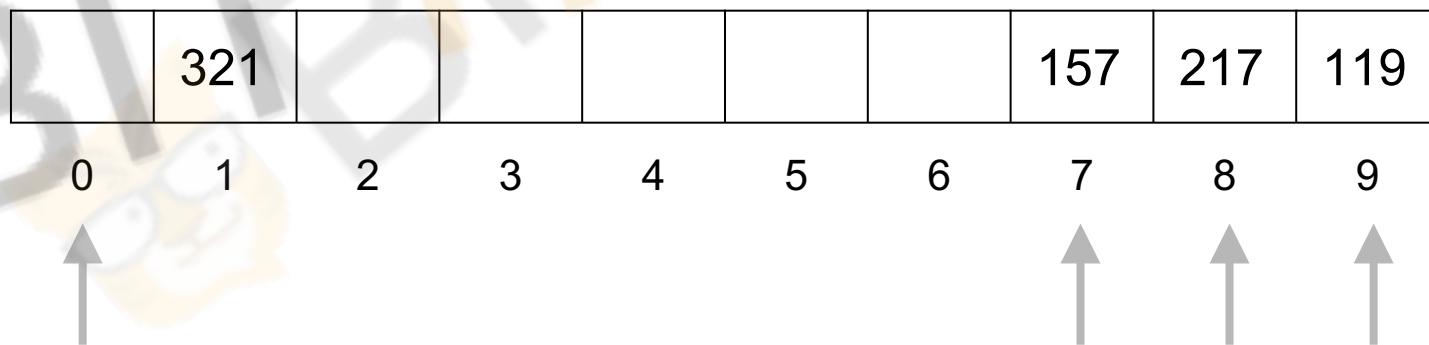

# Hash Table: Linear Probing

add(217)

$$217 \% 10 = 7$$

add(487)

$$487 \% 10 = 7$$

# Hash Table: Linear Probing

add(217)

$$217 \% 10 = 7$$

add(487)

$$487 \% 10 = 7$$

Clustering!

487	321						157	217	119
0	1	2	3	4	5	6	7	8	9

# Hash Table: Rehashing

add(12)

$$12 \% 10 = 2$$

487	321	222	343	894	155	16	157	217	119
0	1	2	3	4	5	6	7	8	9

# Hash Table: Rehashing

add(12)

487	321	222	343	894	155	16	157	217	119
0	1	2	3	4	5	6	7	8	9

	321	222	343			487							894	155	16	157	217	119	
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19

# Hash Table: Rehashing

add(12)

$$12 \% 20 = 12$$

	321	222	343			487								894	155	16	157	217	119
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19

# Hash Table: Rehashing

add(12)

$$12 \% 20 = 12$$

Load Factor  
= number of entries / length

	321	222	343			487						12			894	155	16	157	217	119
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	

Let play back a little bit

BITTIGER

# Hash Table: Separate Chain

add(217)

$$217 \% 10 = 7$$

	321						157		119
0	1	2	3	4	5	6	7	8	9

# Hash Table: Separate Chain

add(217)

$$217 \% 10 = 7$$

# Hash Table: Separate Chain

add(217)

$$217 \% 10 = 7$$

add(487)

$$487 \% 10 = 7$$

# Hash Table: Separate Chain

add(217)

$$217 \% 10 = 7$$

add(487)

$$487 \% 10 = 7$$

# Hash Table

- Use hashCode and array length to get index of array.
- Collision
  - Linear Probing (Clustering)
  - Separate Chain (Java implementation)
- Rehashing when number of elements is growing faster ( $\frac{2}{3}$ )
- Hash Table
  - Near  $O(1)$  search time complexity
  - Near  $O(1)$  to add a new element

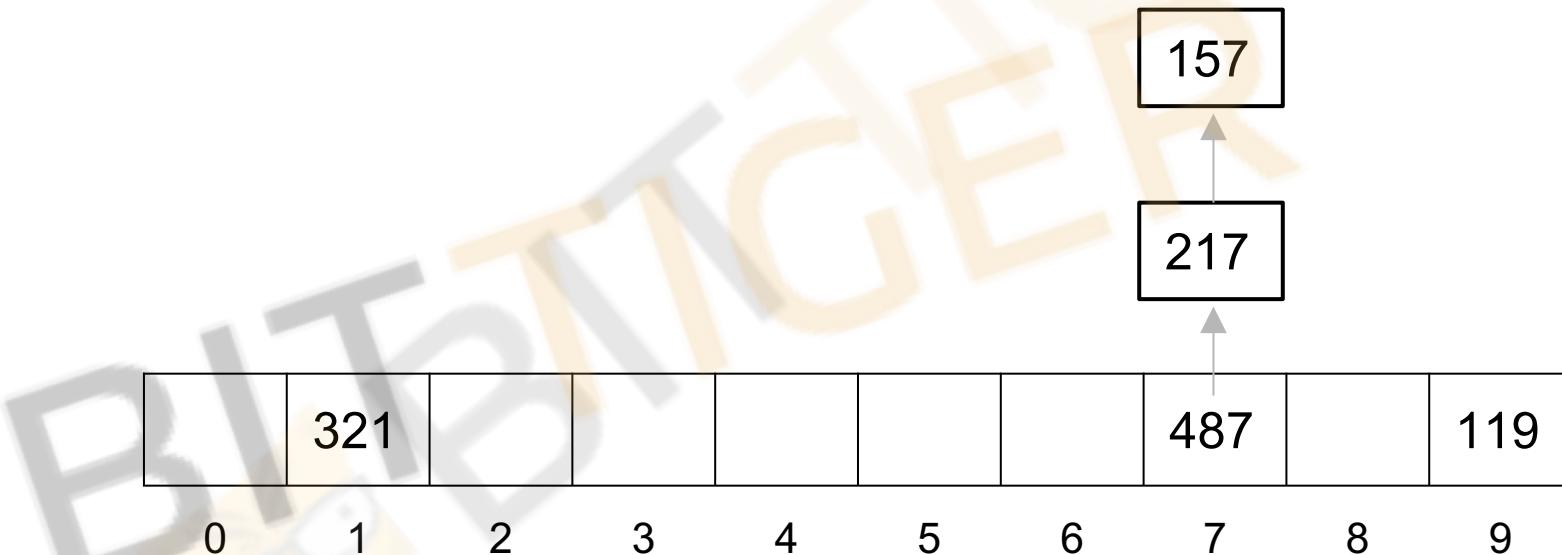

# HashTable v.s. HashMap

	<b>HashTable</b> (Legacy API)	<b>HashMap</b>
Synchronization	synchronized/thread-safe	Non thread-safe/ Better performance
Null	Don't allow null keys	allows one null key and any number of null values
Others		LinkedHashMap/ConcurrentHashMap

# HashMap: Iteration

321, 487, 217, 157, 119

# HashMap (prior to Java 7)

- Separate Chain HashTable Implementation
- In Java 8, HashMap has some performance improvement!

# HashSet

```
public HashSet(int initialCapacity) {  
    map = new HashMap<>(initialCapacity);  
}  
  
public boolean add(E e) {  
    return map.put(e, PRESENT)==null;  
}  
  
private static final Object PRESENT = new Object();
```

HashSet is a wrapper class of HashMap.  
Value is a constant dummy object.

# HashMap and HashSet in Java

<b>HashMap -</b> <a href="https://docs.oracle.com/javase/7/docs/api/java/util/HashSet.html">https://docs.oracle.com/javase/7/docs/api/java/util/HashSet.html</a>	<b>HashSet -</b> <a href="https://docs.oracle.com/javase/7/docs/api/java/util/HashMap.html">https://docs.oracle.com/javase/7/docs/api/java/util/HashMap.html</a>
containsKey(Object key) -- boolean	size() -- int
containsValue(Object value) -- boolean	contains(Object o) -- boolean
get(Object key) - v	remove(Object o) -- boolean
put(Object key, Object value) - v	add(E e) - boolean
